

BurpSuite intro

Jarrett Lane

What is BurpSuite

- Application for web security testing
- Can do things like:
 - Act as a client proxy (That means it intercepts a request before its sent)
 - Web crawl (Map out the website as you interact with it)
 - Keep a log of past requests
 - Repeater (send a custom request over and over from burpsuite)
 - Decoder (decode from common formats)
 - Sequencer (Analyze tokens for randomness strength)
 - Comparer (compare content of requests)
 - More (You have to pay)

How to get BurpSuite

-
- Make sure you get the community edition its free
 - Download the right version for your system
 - <https://portswigger.net/burp/releases/professional-community-edition-2025-12-5?requestededition=community&requestedplatform=>
 - Go straight to downloads don't enter your email to download unless you want

Set Up Burpsuite

- You need FoxyProxy or some extension like that on your browser
- The idea is for your browser to send the request to burpsuite, not out to the internet
- You need to set up foxy proxy to send to a port on your local address that BurpSuite is choosing to listen on
- I use port 8081, you can use whatever works
- Also I recommend using Firefox because that's what I've always used and haven't had problems
- Update: BurpSuite gives you a chromium browser you can use directly

Using BurpSuite

-
- I usually use the proxy feature and sometimes the repeater so that's what I will show you
 - The proxy lets you modify your request directly, this is very useful
 - The repeater lets you continuously send out a specific request, which can be modified each time, great for testing payloads or race conditions
 - (Note: there are other ways to do this, like curl or a python script, use what you prefer but I want you to know burpsuite)

Now lets actually use it

-
- I'm going to walk through a challenge then you all will try it
 - Also remember, the company that does burpsuite, port swigger, offers lots of learning resources: <https://portswigger.net/web-security/learning-paths>
